

Panel beaters find rust solution with Prolan

Masters Panel beaters have been in business for many years treating the underbodies and door panels of vehicles for rust. Masters Panel beaters operate in Kaitaia which is only a few kilometers from the east and west coasts of New Zealand.

The moist salt air and salt water on the beach cause many vehicles to rust out within a few years. Tourist operators run vehicles daily along ninety mile beach exposing them to salt and spray.

Solution

The teams at Master Panel beaters were having trouble Sourcing their existing rust preventative sprays and were looking for new products, so they set up a test piece of steel outside the front of their workshop to evaluate different products and choose their best option.

The advantage of the Prolan Heavy grade liquid spray is:

- Tourist operators have to water blast vehicles after each trip along ninety mile beach, Prolan's affinity for sticking to the steel will stop water blasting from washing the product off.
- It is also a clean easy to use biodegradable product that will not affect the environment.

Results

The area on the right of the photo above with no rust has been coated with Prolan heavy grade spray. The other two patchy areas are different products that are no longer providing any protection.

The Prolan has lasted for 20 months exposed to the weather elements and still shows little sign of rust.
